Technology Risks

In healthcare, one of your most valuable assets is information, especially as digital imaging becomes the standard. How you protect that information is key. Viruses, hackers, hardware failure and natural disasters are serious threats to data integrity, availability and your liability.

The trust your patients put in you is not easily earned. PRS understands that one security breach or even unplanned downtime can destroy the goodwill you have worked so hard to build.

Proper planning can reduce risks significantly and often requires only simple changes to processes or technology configurations. PRS can help identify these steps thoroughly while remaining sensitive to your budget.

PRS can help you create a powerfully effective, yet simple Disaster Recover Plan.

The Health Insurance Portability and Accountability Act (HIPAA) concerns all institutions that manage and store Personal Health Information (PHI). Compliance is a concern because new laws can be ambiguous and have not yet been tested in the courts. Technology requirements are now mandated by law.

As those who work in the healthcare industry know, an ounce of prevention is worth a pound of cure. Allow PRS to evaluate your technology hardware, software and procedures to help ensure that you are prepared. After all, the only thing worse than disaster is facing disaster unprepared.
